

My Kitchen

Your recipes. Your body. Your goals. A personal recipe adaptation assistant, built as a Progressive Web App.

Files

File	What it does
<code>index.html</code>	Page shell and navigation
<code>styles.css</code>	Bakery visual design (light and dark mode)
<code>core.js</code>	Data model, storage, migration, helpers
<code>service.js</code>	Adaptation service: nutrition engine, built-in rules, Claude engine
<code>screens.js</code>	All screens
<code>actions.js</code>	Buttons, inputs, the Make It Mine flow, startup
<code>sw.js</code>	Offline support
<code>manifest.webmanifest</code> + icons	Install to home screen

Scripts must load in the order shown in `index.html`.

Publish on GitHub Pages

1. Upload every file to the root of the repository (keep the names exactly).
2. Settings → Pages → Deploy from branch → `main` / root.
3. Open the Pages link on your phone and choose Add to Home Screen.

Updating

After uploading changed files, edit `VERSION` in `sw.js` (for example `v2.0.1`) so installed copies pick up the new version.

Notes

- Data is stored in the browser (`localStorage`), per device. Use Profile → Export my cookbook for backups.
- On GitHub Pages, adaptations use the built-in rules (labelled "not AI"). Claude-powered reading of photos and AI adaptation only works when the app runs inside Claude.
- Nutrition is estimated from typical ingredient values unless you enter label values.
